this text provides an accessible self contained and rigorous introduction to complex analysis and differential equations topics covered include holomorphic functions fourier series ordinary and partial differential equations the text is divided into two parts part one focuses on complex analysis and part two on differential equations each part can be read independently so in essence this text offers two books in one in the second part of the book some emphasis is given to the application of complex analysis to differential equations half of the book consists of approximately 200 worked out problems carefully prepared for each part of theory plus 200 exercises of variable levels of difficulty tailored to any course giving the first introduction to complex analysis or differential equations this text assumes only a basic knowledge of linear algebra and differential and integral calculus moreover the large number of examples worked out problems and exercises makes this the ideal book for independent study

entire functions of several complex variables constitute an important and original chapter in complex analysis the study is often motivated by certain applications to specific problems in other areas of mathematics partial differential equations via the fourier laplace transformation and convolution operators analytic number theory and problems of transcendence or approximation theory just to name a few what is important for these applications is to find solutions which satisfy certain growth conditions the specific problem defines inherently a growth scale and one seeks a solution of the problem which satisfies certain growth conditions on this scale and sometimes solutions of minimal asymptotic growth or optimal solutions in some sense for one complex variable the study of solutions with growth conditions forms the core of the classical theory of entire functions and historically the relationship between the number of zeros of an entire function $f(z)$ of one complex variable and the growth of f or equivalently $\log f$ was the first example of a systematic study of growth conditions in a general setting problems with growth conditions on the solutions demand much more precise information than existence theorems the correspondence between two scales of growth can be interpreted often as a correspondence between families of bounded sets in certain frechet spaces however for applications it is of utmost importance to develop precise and explicit representations of the solutions

a first course in complex analysis with applications limits theoretical coverage to only what is necessary and conveys it in a student friendly style its aim is to introduce the basic principles and applications of complex analysis to undergraduates who have no prior knowledge of this subject contents of the book include the complex number system complex functions and sequences as well as real integrals in addition to other concepts of calculus and the functions of a complex variable this text is written for junior level undergraduate students who are majoring in math physics computer science and electrical engineering

this book contains a selection of more than 500 mathematical problems and their solutions from the phd qualifying examination papers of more than ten famous american universities the problems cover six aspects of graduate school mathematics algebra differential geometry topology real analysis complex analysis and partial differential equations the depth of knowledge involved is not beyond the contents of the textbooks for graduate students while solution of the problems requires deep understanding of the mathematical principles and skilled techniques for students this book is a valuable complement to textbooks for lecturers teaching graduate school mathematics a helpful reference copyright libri gmbh all rights reserved

strategic intelligence management introduces both academic researchers and law enforcement professionals to contemporary issues of national security and information management and analysis this contributed volume draws on state of the art expertise from academics and law enforcement practitioners across the globe the chapter authors provide background analysis and insight on specific topics and case studies strategic intelligent management explores the technological and social aspects of managing information for contemporary national security imperatives academic researchers and graduate students in computer science information studies social science law terrorism studies and politics as well as professionals in the police law enforcement security agencies and government policy organizations will welcome this authoritative and wide ranging discussion of emerging threats hot topics like cyber terrorism big data and somali pirates addressed in terms the layperson can understand with solid research grounding fills a gap in existing literature on intelligence technology and national security

the book constitutes a basic concise yet rigorous course in complex analysis for students who have studied calculus in one and several variables but have not previously been exposed to complex analysis the textbook should be particularly useful and relevant for undergraduate students in joint programmes with mathematics as well as engineering students the aim of the book is to cover the bare bones of the subject with minimal prerequisites the core content of the book is the three main pillars of complex analysis the cauchy riemann equations the cauchy integral theorem and taylor and laurent series expansions each section contains several problems which are not purely drill exercises but are rather meant to reinforce the fundamental concepts detailed solutions to all the exercises appear at the end of the book making the book ideal also for self study there are many figures illustrating the text
